

METHOD AND APPARATUS FOR DATA TRANSFER

ABSTRACT OF THE DISCLOSURE

5 A method for data transfer includes: detecting the initiation of a primary
service function being performed on an entity in a known location; responsive to
the detection, establishing a communications link (150) with the entity; managing
a transfer of data via the communications link (150); and terminating the data
transfer when at least one condition has been met. A device for enabling a
10 communications link to be established with an entity while it is being refueled
includes: a first communications element (414) coupled to a fueling system; and a
second communications element (434) coupled to the entity, wherein a
communications link (150) is established with the entity when the first and second
communications elements (414,434) are operatively aligned.
